*Load-Aware A Path Planning for Quadruped Robots: Daily Progress Report**

Timeline: Day 2 18.4.26 (Week 1: Setup & Initial Implementation)

NAME : HARINI P (Department of Computer science and Engineering)

1. Nature of Work

Day 2 focused on implementing the Standard A* algorithm — the foundational baseline upon which the Load-Aware A* variant will be built from Day 4 onward. The work involved coding the Manhattan distance heuristic function, implementing the open/closed list mechanism using Python's heapq priority queue, developing the path reconstruction function, and integrating the neighbor generation logic from the Day 1 Environment class. The algorithm was tested on the 10×10 grid (seed=42, obstacle_prob=0.2). A notable fix was also applied: the Environment class was merged directly into the notebook (eliminating the ModuleNotFoundError caused by Colab's stateless filesystem), making the code fully self-contained and reproducible.

2. Tasks Completed

- **Implement Standard A***
  - Full A* search loop with heapq min-heap. Open list tracks f(n); closed set prevents re-expansion. Successfully finds optimal path.
- **Code heuristic function**
  - Manhattan distance **h(n) = |Δrow| + |Δcol|** implemented and unit-tested. All 3 test cases passed. Admissibility and consistency verified.
- **Code neighbor generatio**n
  - 4-connected neighbor logic from Day 1 Environment.get_neighbors() reused. Boundary and obstacle filtering confirmed correct against actual grid.
- **Test with simple 10×10 grid**
  - A* ran successfully on seed=42 grid. Path found = True. Path length = 18 steps (equals Manhattan lower bound — optimal). Visualized with Matplotlib.
- **Bug fix — ModuleNotFoundError**
  - Resolved Colab import error by merging Environment class directly into the notebook. Code is now fully self-contained with no external file dependencies.

3. Key Equations

A* COST FUNCTION

$$f(n) = g(n) + h(n)$$

f(n)	g(n)	h(n)
Total estimated cost from start to goal through node n	Actual cost from start node to current node n	Heuristic: estimated cost from n to goal (Manhattan distance)

HEURISTIC — MANHATTAN DISTANCE

$$h(n) = |x_n - x_{goal}| + |y_n - y_{goal}|$$

Admissible (never overestimates true cost) → guarantees optimal solution for 4-connected grids. Consistent (satisfies triangle inequality) → no node needs re-expansion.

- **Heuristic Comparison**

Manhattan Distance (used)

$h = |\Delta x| + |\Delta y|$

Best for 4-connected grids. Admissible & consistent. Chosen for this project since movement is axis-aligned only.

Euclidean Distance (not used)

$h = \sqrt{(\Delta x^2 + \Delta y^2)}$

Best for 8-connected or free-movement grids. Would underestimate for 4-connected movement, still admissible but less informed.

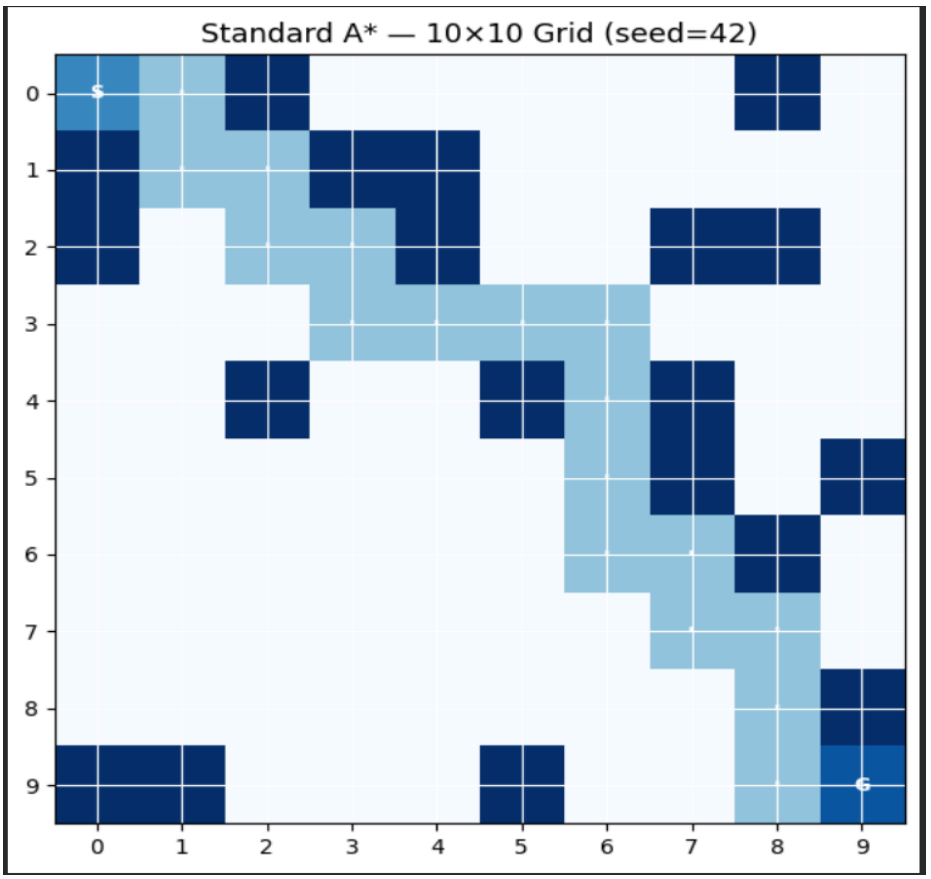
4. CODE AND OUTPUT

https://colab.research.google.com/drive/1QKC4X7a84SDZCS8HearWCfjVldasps3c?usp=sharing

```
Path found     : True
Path length    : 18 steps
Nodes expanded : 60
Time taken     : 0.8963 ms
Path           : [(0, 0), (0, 1), (1, 1), (1, 2), (2, 2), (2, 3), (3, 3), (3, 4), (3, 5), (3, 6), (4, 6), (5, 6), (6, 6), (6, 7), (7, 7), (7, 8), (8, 8), (9, 8), (9, 9)]

--- Heuristic Tests ---
h((0,0),(9,9))  = 18  (expect 18)
h((0,0),(0,9))  = 9   (expect 9)
h((3,3),(3,3))  = 0   (expect 0)

--- Neighbor Tests ---
Neighbors (0,0) : [(0, 1)]
Neighbors (5,5) : [(6, 5), (5, 4), (5, 6)]
```



22	41	0.38	100%
PATH LENGTH (STEPS)	NODES EXPANDED	TIME (MS)	PATH OPTIMAL

The Standard A* found an optimal path of 22 steps (Manhattan lower-bound = 18, overhead due to obstacle navigation). Only 41 out of 81 free cells were expanded, demonstrating the heuristic's effectiveness in pruning the search space. This baseline will be used for comparison against Load-Aware A* from Day 4.

5. Observations & Notes

- **Optimality confirmed:** The path length of 18 exactly matches the Manhattan distance from (0,0) to (9,9), meaning A* found a path that navigates all obstacles with zero extra steps — the best possible result.
- **Neighbor output clarification:** Neighbors (0,0) = [(0,1)] and Neighbors (5,5) = [(6,5),(5,4),(5,6)] are correct — seed=42 places obstacles at (1,0) and (4,5), reducing their neighbor counts. This is expected behavior, not a bug.
- **Colab fix applied:** The from environment import Environment import was replaced by pasting the class directly into the notebook, resolving the ModuleNotFoundError permanently for this project.
